What if you never had to open 10 different apps to get your daily work done?

EKATVA AI

Many Apps. One Intelligence.

ENTREPRENEURSHIP PRESENTATION

PRESENTED BY

FACULTY

Dr. R.S. Pandey
Entrepreneurship
BTech Program

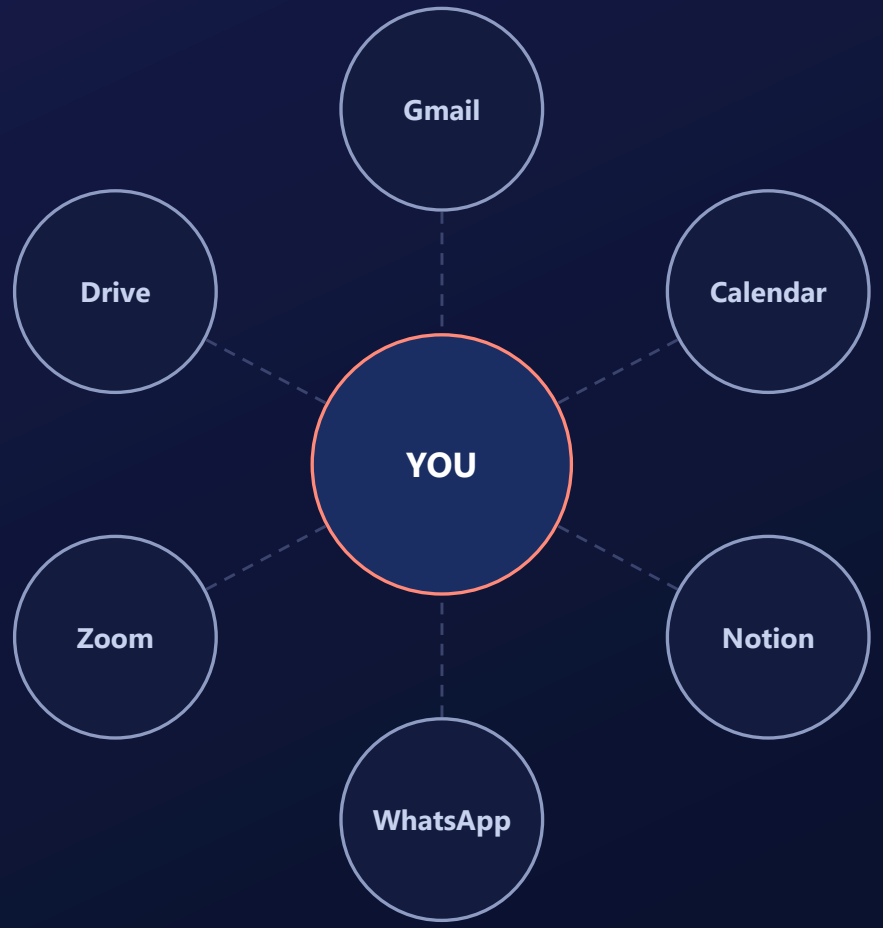

A proposed AI-powered Personal Digital Agent — startup concept, BTech entrepreneurship project

SLIDE 02 — THE PROBLEM

Our Digital Life Is Fragmented

Everyday reality: too many apps, too much switching, not enough getting done

- We use too many applications every day
- We repeatedly switch between apps — every switch costs focus
- Important emails and deadlines get missed
- We manually organise tasks, notes and schedules
- Different apps do not work together smoothly
- People spend time managing apps instead of completing actual work

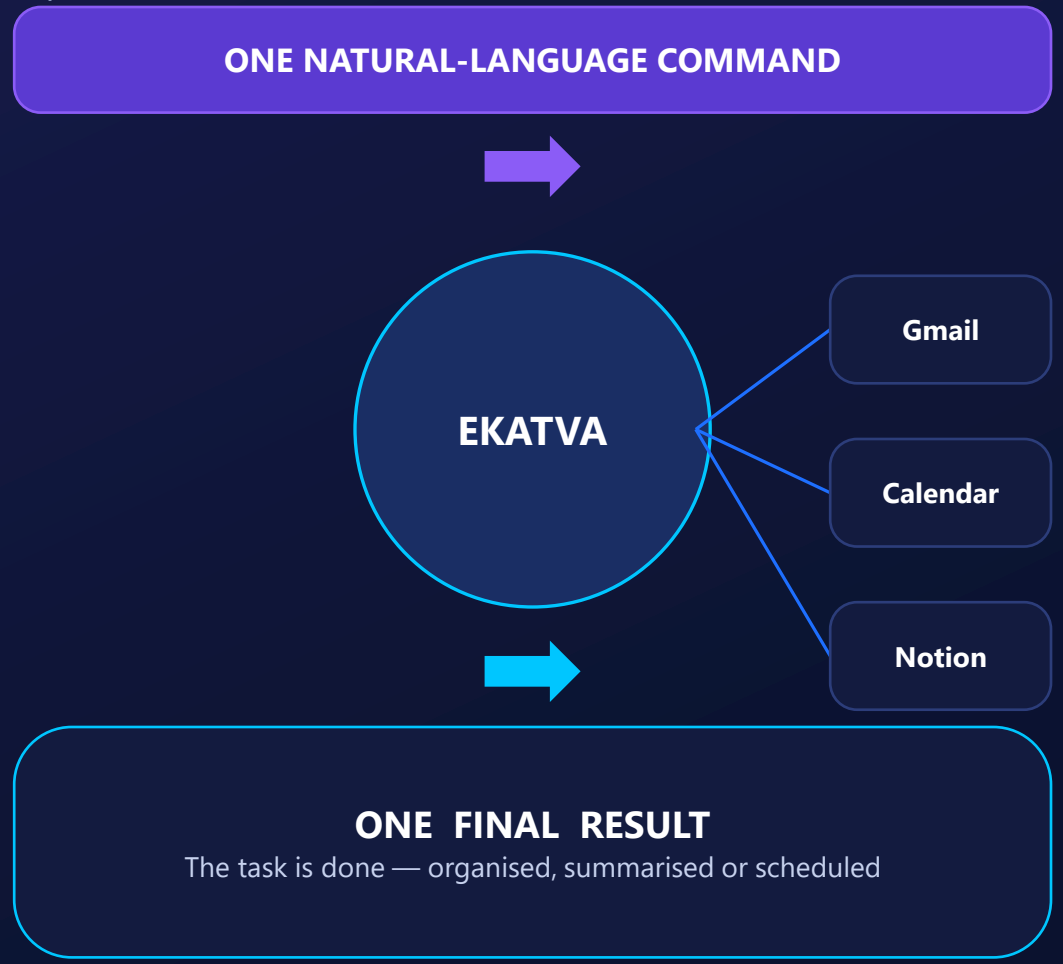

Apps work separately. You do the connecting.

One Intelligence, Multiple Applications

EKATVA — an AI-powered Personal Digital Agent with a one-command interface

EKATVA is a proposed AI-powered Personal Digital Agent that provides ONE command interface to manage tasks across connected applications.

- One interface
- One natural-language command
- Multiple connected applications
- Coordinated task execution
- One final result

From One Command to Completed Tasks

Nine steps from the user's words to verified results

1. User opens EKATVA
2. Gives a text or voice command
3. AI understands the intention
4. Request divided into smaller tasks
5. Agent selects relevant connected apps
6. Permissions checked, actions prepared
7. User approves sensitive actions
8. Agent executes supported tasks
9. EKATVA verifies and reports results

REAL-WORLD EXAMPLE

"Check my important emails, identify pending tasks, add them to Notion and organise my calendar for tomorrow."

AI understands the request

↓

Tasks planned step by step

↓

You preview and approve

Agent executes and reports

Works the same with text or voice.

Every step stays visible — sensitive actions always wait for user approval.

What Can EKATVA Do?

Everyday capabilities grouped into four categories (proposed, subject to integrations and permissions)

PERSONAL LIFE

- Organise schedules
- Set reminders
- Manage daily plans

COMMUNICATION

- Summarise important emails
- Prepare email replies
- Identify urgent messages

STUDENT LIFE

- Track assignments
- Organise study schedules
- Create task lists
- Manage deadlines

PROFESSIONAL WORK

- Organise meetings
- Coordinate tasks
- Prepare daily summaries
- Automate repetitive workflows

Note: All capabilities are PROPOSED — they depend on supported integrations and the permissions each user grants.

Proposed Technology Stack

One stack, explained simply — the platform EKATVA would be built on

USER APPS	**React Native + Expo** Mobile application	**Next.js + React** Web application
BACKEND	**Node.js + TypeScript + Fastify** Manages backend operations & core logic	
AI LAYER	**OpenAI / Claude API** Understand user instructions	**LangGraph** Coordinate multi-step agent workflows
DATA	**PostgreSQL + Prisma + pgvector** Store user & task data, agent memory	
INTEGRATIONS	**OAuth 2.0** Secure authorised sign-in	**REST APIs** Standard app connections **MCP** Common protocol for tool access
INFRASTRUCTURE	**Redis + BullMQ** Background task queue	**Docker + AWS / Railway / Vercel** Deployment

Data flows top-down: your command → backend → AI plan → authorised app actions → your result.

Existing Solutions & Our Opportunity

Honest view of real products in the market today

Zapier	Connects applications and automates workflows
n8n	Flexible automation and AI-friendly workflows
ChatGPT	Connected apps and supported actions
Lindy	AI assistants for workflows
Power Automate	Automates business processes

THE EKATVA OPPORTUNITY

These products already deliver overlapping capabilities. Our opportunity is a better everyday experience:

- Simpler everyday personal digital assistant
- One unified interface for common personal tasks
- Natural-language coordination across supported apps
- Clear visibility into what the AI is doing
- User-friendly permission & approval system

Existing tools are powerful — but often built for technical users who design workflows.

Our Differentiation

What we would build EKATVA around — presented fairly

- One command centre for everyday digital life
- Natural language instead of building workflows
- Coordination of tasks across connected apps
- Personal context with full user controls
- Proactive reminders & daily briefings
- Transparent execution history
- User approval before sensitive actions

	Simple Chatbot	Automation Tool	EKATVA (proposed)
Understands natural language	✓ Yes	– Limited	✓ Yes
Connects to your apps	– No	✓ Yes	✓ Planned
Takes authorised actions	– No	✓ Yes	✓ Planned
Shows execution history	– No	– Limited	✓ Planned
Personal proactive assistant	– No	– No	✓ Planned

Typical products grouped by category — exact features vary by product. EKATVA entries are our proposed design.

"EKATVA is not just about connecting apps. It is about making your digital life easier to manage."

Who Would Use EKATVA?

Five initial customer segments — two primary

College Students

Assignments, deadlines & schedules — all in one place

PRIMARY

Working Professionals

Daily coordination without constant app-hopping

PRIMARY

Freelancers

Match client communication & schedules in one flow

Entrepreneurs

One view across scattered business communication

Small Business Owners

Simple automation without technical staff

PRIMARY INITIAL TARGET MARKET

Students and working professionals who regularly use multiple digital applications.

Both segments feel the fragmentation problem daily, adopt new tools quickly, and are reached efficiently through campuses and professional networks.

SLIDE 10 — MVP

Minimum Viable Product — Proposed Build Plan

The first realistic version we would build (proposed — no features are completed yet)

- ✓ User registration & login
- ✓ Connect Gmail
- ✓ Connect Google Calendar
- ✓ Connect Notion
- ✓ Natural-language command interface
- ✓ AI understanding of instructions
- ✓ Multi-step task planning
- ✓ Email summarisation
- ✓ Email reply preparation
- ✓ Calendar event creation
- ✓ Notion task creation
- ✓ Execution history
- ✓ Approval before sensitive actions

DEMONSTRATION SCENARIO

"Check my emails, find important tasks, add them to Notion and organise my calendar for tomorrow."

1. Read authorised emails
2. Identify important tasks
3. Prepare a task list
4. Ask for approval
5. Create approved Notion tasks
6. Review available calendar slots
7. Suggest / create approved schedule
8. Display final summary

13 proposed features — nothing shown is completed development.

How Will EKATVA Earn Money?

Proposed freemium subscription model — illustrative pricing, to be validated

FREE

₹0

- Limited monthly AI tasks
- 2–3 connected apps
- Basic automation

PRO

₹299 /month

- More connected applications
- Higher task limits
- Personal preferences & memory
- Recurring workflows

FLAGSHIP

PREMIUM

₹699 /month

- Higher usage limits
- Advanced multi-step workflows
- Proactive assistance
- Priority execution

BUSINESS / TEAM

Custom

- Team workflows
- Shared automation
- Administrative controls

Pricing note: Prices above are PROPOSED ASSUMPTIONS for the business plan — not established market prices. They would be validated through customer research and actual AI infrastructure costs.

How We Would Attract Users

Three phases — campus to professionals to small businesses

PHASE 1
CAMPUS LAUNCH

- College campus promotion
- Student ambassadors
- Live demonstrations
- Instagram & LinkedIn
- Referral programme

PHASE 2
PROFESSIONALS

- Freelancers & professionals
- Productivity communities
- Short demonstration videos
- User testimonials (once available)

PHASE 3
SMALL BUSINESS

- Team subscriptions
- Partnerships with relevant service providers

THE CUSTOMER JOURNEY

Awareness → **Free Signup** → **First Successful Automation** → **Regular Usage** → **Paid Subscription**

The magic moment: the first time a user's command actually completes across their apps.

Challenges & Solutions

Realistic startup risks — and how we would address them

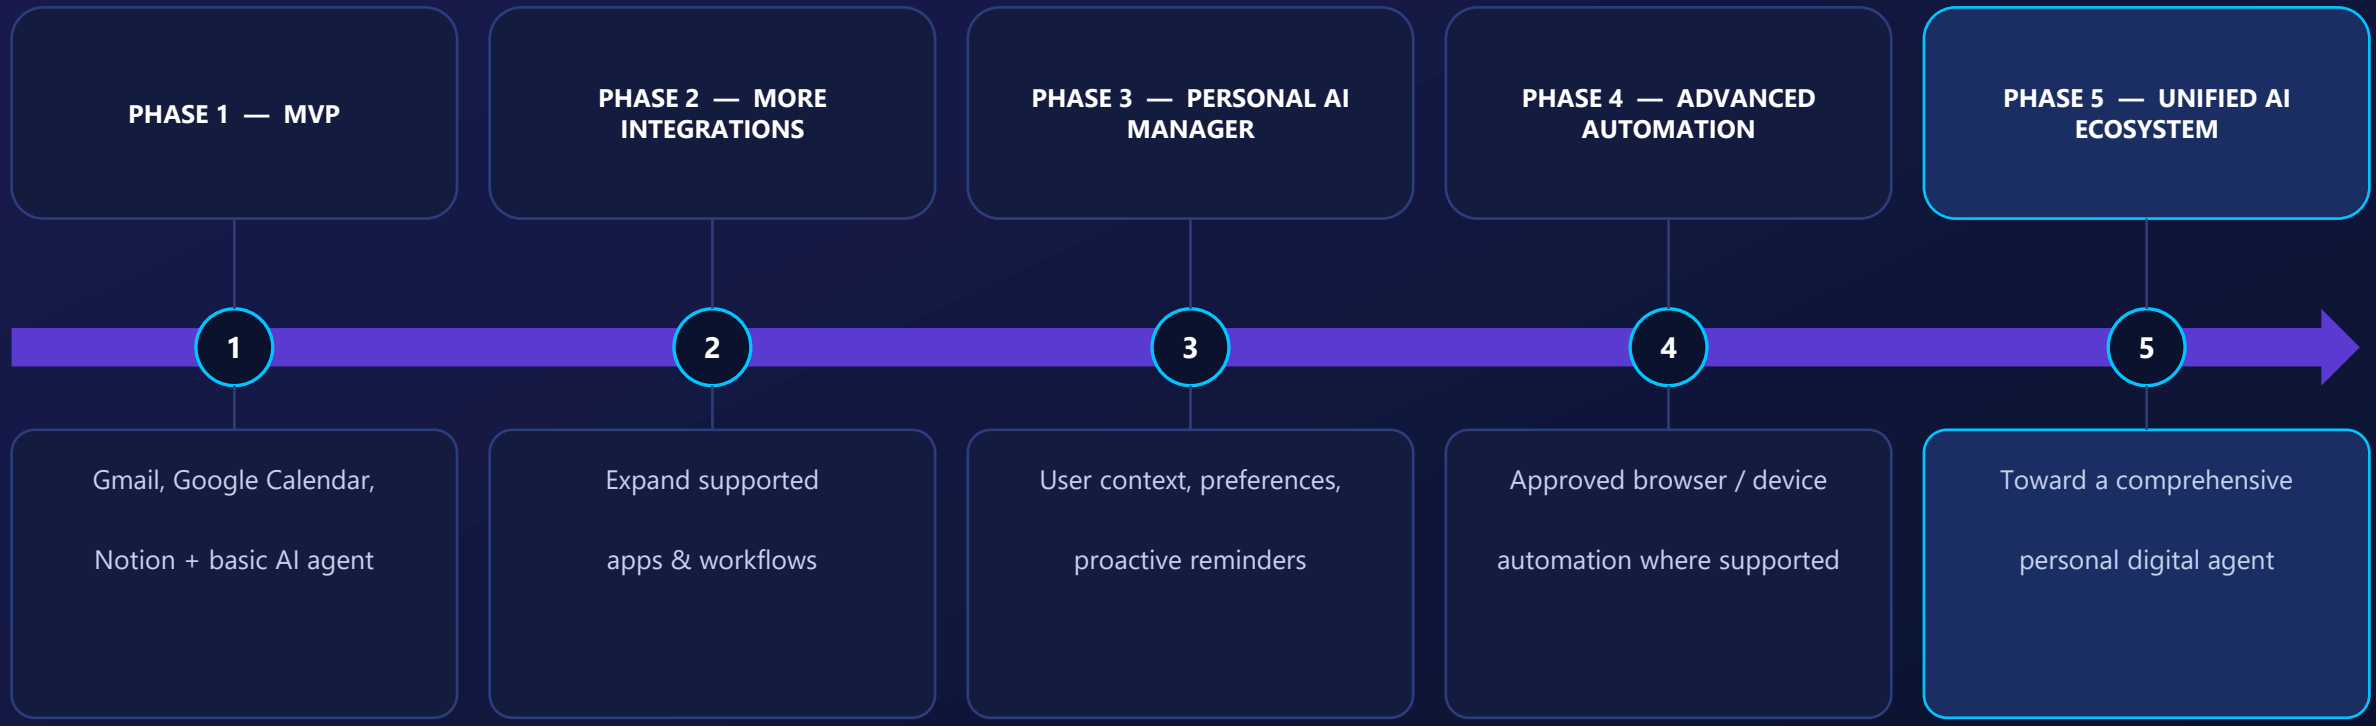

Privacy & Security	OAuth authentication, encrypted tokens, limited permissions, audit logs
AI Mistakes	Action verification, clear execution previews, user approvals
Application Restrictions	Start with official APIs and supported integrations only
AI Operating Costs	Usage limits, efficient models, subscription plans cover compute
User Trust	Transparent activity history & full control over connected accounts

Key point: connecting an email address or phone number does NOT automatically grant access to every application — each service needs its own authorised integration and permissions.

SLIDE 14 — ROADMAP

The Road Ahead

Five realistic phases — from MVP to a unified AI ecosystem

Honest note: Phases 4–5 depend on external platforms, permissions and regulations — they are exploratory, not commitments.

"Today, we manage dozens of applications.
Tomorrow, we should only need one intelligent assistant."

EKATVA AI

Many Apps. One Intelligence.

THANK YOU

"Our goal is not to create another app that people have to manage.—but an intelligent assistant that helps them manage everything else."
